## Assignment 8

### 1. Part 1

I designed a web portfolio that is intended to showcase my creativity, insightfulness, and humanitarian concern in a diverse array of multidisciplinary fields including HCI, architecture, and art. The projects I selected for my web portfolio included representative works from a variety of topics including interactive design, HCI research, educational game, computational design, and architectural and urban design. My web portfolio is made interesting and engaging through the clear layout and smooth animations that make the whole experience more interactive. My target audience is anyone who wants to know me as a designer as well as person.

### 2. Part 2

On home page, click on "HCI", "Architecture", or "Art" to proceed to corresponding section (project overview). Then on each page, click on the navigation bar on the left to go to another section (or click on the current section to scroll to top of page). Click on the project image to view projects (for "Art", just hover over the images to view the enlarged images). When viewing projects, simply click arrow on the top to return to the project overview page.

### 3. Part 3

I incorporated some animations in my web portfolio. This is to make my portfolio more interactive and flow more smoothly. For example, when users hover over my projects, they would see images becoming larger and clickable so that they know they can access my projects through this way.

### 4. Part 4

There are no major changes, except that instead of displaying my projects in an album view, I decided to go with a simple scroll-down view (with a "back to top" button at the bottom).

### 5. Part 5

My major challenge in implementing my web portfolio is animations. I did not work with animations before, and I'm still learning different kinds of animations to make my pages flow smoothly and more interactive.
